Detailed Job Description: At UNIFY, great ideas have a way of becoming great products, services, and customer experiences very quickly. Bring passion and dedication to your job and there's no telling what you could accomplish.

We are looking to hire extraordinary individuals with strong communication and interpersonal skills and ability to work effectively across multiple business and technical teams. As a part of

this team you will build cutting edge software service, one that is continually innovating and is proud of making a difference.

You should be a self starter, motivated, with exceptional interpersonal skills as well as a positive and flexible approach to problems. The applicant should have the ability to thrive in a fast-paced, tight deadline delivery timeline. As a part of this dynamic team, the applicant will help us build the product experience on a global scale.

If you've responded positively to the above questions and want to work in a great, international team, that is passionate, creative, ambitious, open to knowledge-sharing, and loves to cooperate with each other - join us!

Key Qualifications:
- Experience of **designing and developing scalable enterprise level Java back-end applications** with a minimum of 5+ years'
- Strong fundamentals in **Core Java, data structures & algorithms, multi-threading**, concurrency and frameworks like Spring.
- Strong hands-on programming experience in **Java/J2EE, Spring/ Spring Boot/ Hibernate** - building middleware or backend applications.
- Position1: Experience in **architecting Microservices applications and multi tenant RESTful APIs**
- Position2: Experience and a **strong understanding of AWS along with DevOps** relevant tools and technologies
- Position3: Experience with RDBMS like Oracle and **NoSQL databases** such as MongoDB, Couchbase, Elasticsearch
- Hands-on programming experience in DB schema design and data access technologies
- Work with relational and/or NoSQL database systems such as Oracle, PostgreSQL, Cassandra, etc.
- Understand security concepts and app-to-app authentication schemes
- Solid knowledge of applications performance improvement techniques and caching solutions and building low latency web applications
- Experience with Reactive Java applications is a plus
- Knowledge of containerization of applications using Docker, Kubernetes and CI/CD deployment pipelines is a plus
- Knowledge of Full stack development and Big Data technologies is a plus
- Excellent time management skills with the ability to manage work to tight timelines and handle the pressure of executive requests and product launches
- Experience with leading and mentoring Engineers

Roles & Responsibilities:

- Design and implement web APIs.
- Your responsibility will be building and maintaining high-traffic server side micro services that provide the API endpoints for the Product-App.
- Translate business requirements by business team into data and engineering specifications.
- Ability to distinguish/combine relevant SQL and NoSQL technologies to architect the right solution and create API specs.
- Build highly performing, high volume low latency secure RESTful microservices.
- Looking for seasoned backend engineers to develop new and innovative applications as well as debug and refactor existing applications.
- Ability to build, Collaborate with UI team, Business, Data Engineers and project managers.
- Review technical designs and perform code review.
- Comfortable and effective working in an Agile development methodology.
- Ability to optimally multi-task and support multiple, concurrent projects,
